### Genera Graminum. Grasses of the World | SpringerLink

Poaceae or Gramineae is a large and nearly ubiquitous family of monocotyledonous flowering plants known as grasses. It includes the cereal grasses, bamboos and the grasses of natural grassland and species cultivated in lawns and pasture. The latter are commonly referred to collectively as grass. With around 780 genera and around 12,000 species, the Poaceae is the fifth-largest plant family, following the Asteraceae, Orchidaceae, Fabaceae and Rubiaceae. The Poaceae are the most economically impor

### Poaceae - Wikipedia

The most famous modern grass taxonomist at Kew is Derek Clayton. He assembled data on all grasses of the world and published the reference book Genera Graminum in 1986. This compendium of information allowed the study of grass diversity to take a leap forwards, and paved the way for later computerised systems.

### Growing our knowledge of grasses | Kew

For the last 20 years the main generic reference for grasses has been Genera Graminum of Clayton and Renvoize (1986), a subjective compilation of 651 genera from the accumulated knowledge of the collections, library, curation and expertise at the grass herbarium of the Royal Botanic Gardens Kew.

### Classification | GrassWorld

The GPWG therefore decided to represent it by only three genera, Avena, Bromus, and Triticum, but it includes also barley, rye, and all the cool season grasses commonly placed in subfamily Pooideae. The phylogeny correlates well with information from mapping of the nuclear genome (Kellogg, 1998).

### Evolutionary History of the Grasses | Plant Physiology

Rottboellia cochinchinensis is a species of grass known by the common names Itchgrass, Raoul grass, corngrass, Kokoma grass, Guinea-fowl grass, jointed grass, Shamwa grass and Kelly grass. It is a tall, tufted annual grass whose stems grow up to 300 cm in height with leaf-blades of up to 45 cm in length. The species flowers at the apex of culms in the form of spike-like racemes composed of ...

A lot has changed in plant sciences during the last 30 years, and this is a fully functional replacement for the previous desktop references to the world's grasses, Clayton and Renvoize's *Genera Graminum* (1986) and *The Grass Genera of the World* (Watson & Dallwitz, 1994). There are identification keys to the subfamilies and to the genera in each subfamily, lists of common synonyms at the generic level, descriptions, chromosome numbers when known, brief statements of distributions, and ...

**Families and Genera of Vascular Plants. Vol. XIII ...**

Many genera have been erected to accommodate the species that now reside in *Leptochloa*, most notably including: *Diplachne* [based on *L. fusca* subsp. *fascicularis* (Lam.) N.Snow], *Oxydenia* Nutt. [based on *L. panicea* subsp. *brachiata* (Steud.) N.Snow] and *Disakisperma* Steud. [based on *L. dubia* (Kunth) Nees].

**A molecular phylogeny and classification of Leptochloa ...**

About 10 000 species have been described to date, and from a taxonomical point of view, these have been categorized into 700 grass genera using architectural, anatomical, and embryological characteristics (Clayton and Renvoize, 1986; Watson and Dallwitz, 1992). Genera have been unified into subtribes, tribes, supertribes, and subfamilies.

Flores. Apresenta um perigônio formado por 3 verticilos de 2 peças que se reúnem em 1º grau para formar a inflorescência denominada "espigueta". Esta espigueta pode ser formada por 1 a 50 flores, onde algumas podem não ser funcionais. Constituição da espigueta: ráquila, 2 glumas e flor em número variado conforme a espécie, que pode ser unissexual, hermafrodita ou neutra.
