3. Parts of Internal Combustion (IC) Engine: Main parts of the internal combustion engine are: 1. Cylinder: It is the main body of the engine. It has finely machined bore in which piston with rings closely fits and is able to reciprocate. In the cylinder combustion takes place. It should be able to withstand high temperature and pressure.

Combustion is a chemical reaction chemical that occurs between a fuel and an oxidizing agent that produces energy, usually in the form of heat and light. The combustion of fuel in the presence of air takes place inside the cylinder and the products of the combustion directly act on the piston to develop power.

An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

Internal combustion engine - Wikipedia

In an internal combustion engine, the combustion of the fuel takes place within a combustion chamber in the presence of a suitable oxidiser (air, most often). The resultant rise in temperature and pressure from the combustion causes the movement of a specific part of the engine, the piston for example.

The function of the major components of Internal Combustion Engines and their construction materials will now be reviewed. The engine cylinders are contained in the engine block. The block has traditionally been made of gray cast iron because of its good wear resistance and low cost. Passages for the cooling water are cast into the block.

A supercharger is an air compressor that increases the pressure or density of air supplied to an internal combustion engine.This gives each intake cycle of the engine more oxygen, letting it burn more fuel and do more work, thus increasing the power output,. Power for the supercharger can be provided mechanically by means of a belt, gear, shaft, or chain connected to the engine's crankshaft.

Supercharger - Wikipedia

Internal Combustion Engines (IC-engines) produce mechanical power from the chemical energy contained in the fuel, as a result of the combustion process occurring inside the engine IC engine converts chemical energy of the fuel into mechanical energy, usually made available on a rotating output shaft.
