Polyester And Vinyl Ester Coatings

Polyesters and vinyl esters are used in applications that require resistance to aggressive chemicals and elevated temperatures as high as 212 F (100 C) wet or 350 F (177 C) dry. Uses include tank linings; floor linings; secondary containment linings; and coatings for structural steel, walls, and ceilings.

The article discusses the additives for both unsaturated polyester and vinyl ester coatings, namely, curing systems, thixotropic agents and fillers. It exemplifies polyester and vinyl ester coating, lining and flooring systems that are used for top-to-bottom protection of industrial plants and equipment.

On a broad scale of viscosity, vinyl esters are midway between polyesters and epoxy resins, before adding styrene. Thinning effects workability and strength - 'thinning' reduced strength but makes it easier to brush or spray. Vinyl esters

Vinyl Ester vs Polyester Resins: Pros and Cons of Each

Vinyl ester resins are a cross between polyester resins and epoxy resins. These coatings typically exceed both polyester and epoxy in corrosion resistance, temperature resistance, and elongation (toughness). Because of this, vinyl esters are generally used when high durability, thermal stability, and extremely high corrosion resistance are a performance requirement.

Hawkeye Industries is proud to be the master distributor of the Duratec line of putties, primers, sealers, and topcoats. Duratec Polyester and Vinyl Ester products are famous for their ability to cure completely when applied to plug/pattern surfaces. That thin-film, air-cure capability makes Duratec ideal for the composites industry.

Vinyl ester resin falls between the polyester and epoxy resin when it comes to different characteristics and cost. It has a longer molecular chain than polyester resin which helps it absorb impact better than polyester and it shrinks less. There is also less chance of de-lamination when using VE resin.

Vinyl Ester - Chemical Resistance

In laymen's terms, vinyl ester resin can be described as something like a cross between polyester resin and epoxy resins. This combination is typically capable of providing greater resistance properties when exposed to corrosive conditions than do either resin individually.
