packets with rules defined in these tables and then takes the specified action on a possible match. Tables is the name for a set of chains. Chain is a collection of rules.

### **iptables command in Linux with Examples**

Iptables is used to set up, maintain, and inspect the tables of IP packet filter rules in the Linux kernel. Several different tables may be defined. Each table contains a number of built-in chains and may also contain user-defined chains. Each chain is a list of rules which can match a set of packets.

### **iptables(8) - Linux man page**

`iptables-A INPUT -p tcp -m tcp --tcp-flags FIN,SYN FIN,SYN -j LOG --log-prefix=iptables: iptables-save and iptables-restore.` The `iptables/ip6tables` commands provide a way to insert, delete and manage rules. However, the workflow isn't particularly nice. First, you have to first list the existing rules.

## Iptables

iptables is a user-space utility program that allows a system administrator to configure the IP packet filter rules of the Linux kernel firewall, implemented as different Netfilter modules. The filters are organized in different tables, which contain chains of rules for how to treat network traffic packets. Different kernel modules and programs are currently used for different protocols ...

### **iptables**

The user-space application program iptables allows configuring the tables provided by the Linux kernel firewall, as well as the chains and rules it stores.

### **How to configure iptables on CentOS**

`/etc/init.d/iptables start`  
`/etc/init.d/iptables stop`. The init script handles the details of persisting your current firewall configuration on start/stop. Thus, your firewall is always in the state you left it. If you need to manually save a new rule, the init script

# Read Online User Manual

are organized as several sections. Each section has a group of commands for a specific area in Linux usage, administration or development. Here is a list of the sections and introductions to them:

### **Linux Manuals**

Simply put, iptables is a firewall program for Linux. It will monitor traffic from and to your server using tables. These tables contain sets of rules, called chains, that will filter incoming and outgoing data packets. When a packet matches a rule, it is given a target, which can be another chain or one of these special values:
